Cyber-security, online privacy, cyber-crime, big data and online surveillance

We are living in the age of technology, often called the digital age, and this year's conference aims to discuss and educate about the various factors that are of importance and affect us daily in this age. Covered in the theme, cyber-security, online privacy, cyber-crime, big data and online surveillance, these factors are, as the internet, interlinked and connected.

Cyber-security, this term describes the processes and technologies of the application of security measures to protect computers, networks, programs and data from unauthorized access, vulnerabilities and attacks through the internet by the so called cyber criminals. It involves preventative methods created to protect data from being stolen, compromised or attacked. Cyber-security is also referred to as information technology security and requires an understanding of potential information threats such as viruses and other malicious code.

Online Privacy, also known as Internet privacy, refers to the privacy and security level of personal data on the internet. It is a major concern for any user using the internet for online purchases, banking, playing online games or even social networking and entails the amount of control a user has with regards to the flow of information and reasonable access to data generated during an online session.

One of the biggest threats to online privacy in this day and age is that of social networking. People are not aware of their privacy settings, and often times, don't even know the risks associated with revealing and sharing their personal details and information online. As stated in many publications and articles, privacy is a major concern for all Internet users, but it is becoming more difficult to expect a reasonable expectation of privacy online.

Closely connected to that is also the issue of **Online Surveillance**. Some people have no problem with it and are actually in support of it, to the extent of even participating in activities that are in complete violation of their privacy rights and thus total exposure of their private lives to the general public. However, a great majority is quite uncomfortable about the idea of having their every move monitored and still very concerned about their rights to privacy and protection from cyber-crime.

Cyber-crime is also closely linked to cyber-security as it is one of the main reasons for the importance and need of cyber-security. This can be defined as any crime that is committed through the use of a computer and a network, in broader terms, this is the crime committed by electronic communications including any device or the internet or any one of them or more.

Big Data on the rise; capturing, control, storage, sharing and processing of With data has become a major challenge, and whilst this has a lot of cons to it, companies can choose to rather see this as an opportunity as it can help them improve operations and make faster, more intelligent decisions, but in terms of privacy, the battle might as well be lost.
